Tropical season in the Atlantic beginning to heat up

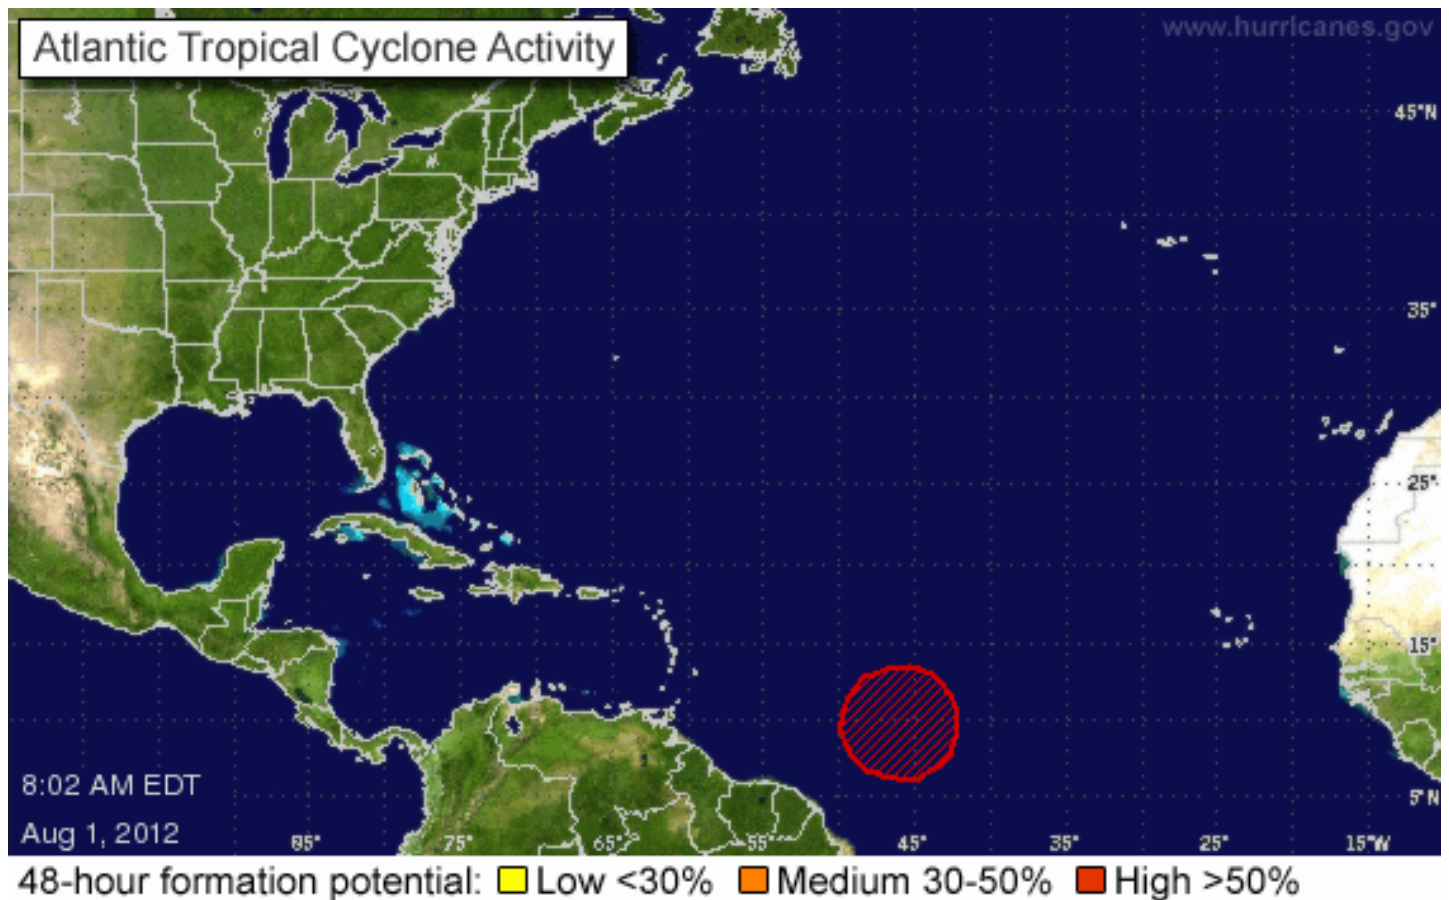

Courtesy of National Hurricane Center

A look at the tropical season climatology for the Atlantic basin show activity should be expanding from just the Gulf of Mexico and Caribbean out to the Atlantic Ocean. Over the coming 12 weeks, this area will become more active and will need to be monitored closely. Notice the peak of the tropical season is still about 6 weeks away.

This morning, the Atlantic Tropical Cyclone activity map from the National Hurricane center is showing the potential for a system to develop. More of the Atlantic systems will originate further east as August progresses.
